WHAT'S NEW

SHOT OF HOPE

- India is nearing major breakthroughs in dengue preventive care with both indigenous and international vaccines

- The Indian Council of Medical Research (ICMR), in collaboration with Panacea Biotec, is overseeing nationwide Phase 3 clinical trials involving over **13,000 VOLUNTEERS** across 19 sites for DengiAll—India's first indigenous single-dose tetravalent dengue vaccine candidate
- The regulatory approvals have paved the way for Japanese drugmaker Takeda's Qdenga (TAK-003) to enter the Indian market, manufactured locally via a strategic partnership with Biological E, which will offer a two-dose preventative option against all four viral serotypes

During the critical phase, blood plasma leaks out into surrounding body cavities, and the actual volume of blood circulating through vital organs rapidly shrinks, causing BP to plunge

DENGUE

FEVER DOWN? DON'T LOWER YOUR GUARD YET

UNNIKRISHNAN S @T'Puram

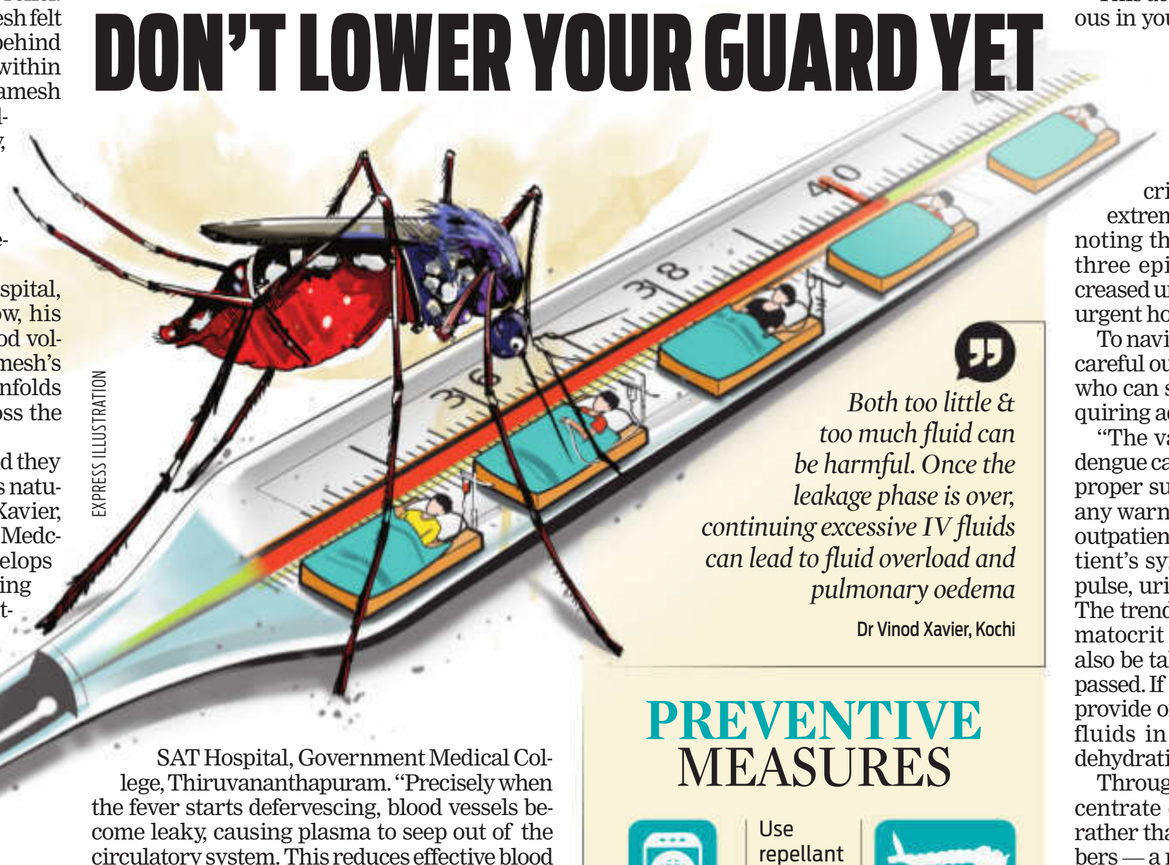

WHEN the thermometer finally read normal after four days of relentless fever, the family of Ramesh Kumar, a 44-year-old schoolteacher from Kollam, breathed a collective sigh of relief. The burning heat had subsided and Ramesh felt slightly better. Believing the worst was behind them, the household relaxed its vigil. Yet within hours, a quiet, dangerous shift began. Ramesh struggled to stand, overwhelmed by sudden light-headedness. His lips grew dry, his hands turned cold, and hours passed without a single visit to the bathroom. What seemed like recovery was, in reality, the opening act of dengue's most deceptive phase.

When his family rushed him to the hospital, his blood pressure was dangerously low, his pulse was rapid, and his circulating blood volume had dropped to precarious levels. Ramesh's ordeal illustrates a medical trap that unfolds during seasonal dengue outbreaks across the country.

"When a patient's temperature falls and they initially appear to be recovering, families naturally drop their guard," says Dr Vinod Xavier, consultant in internal medicine at Aster Medcity, Kochi. "However, if the patient develops postural giddiness on standing, increasing weakness, or markedly reduced urine output, it indicates that their circulatory system is becoming severely compromised. The drop in fever is not necessarily the end of the illness — in many patients, this exact transition marks the onset of plasma leakage."

This dangerous transition period is known clinically as the critical phase, or the defervescence window. While early symptoms are limited to high fever and severe body aches, the nature of the disease transforms entirely between day three and day seven of the illness — most commonly around day five. Instead of fighting an active viral storm, the body begins to battle a sudden failure of its circulatory plumbing.

"The hallmark of the critical phase is capillary leakage," explains Dr Sheeja Sugunan, associate professor and paediatric intensivist at SAT Hospital, Government Medical College, Thiruvananthapuram. "Precisely when the fever starts defervescing, blood vessels become leaky, causing plasma to seep out of the circulatory system. This reduces effective blood supply to major organs, leading to multi-organ dysfunction if left unmonitored."

EXPRESS ILLUSTRATION

> *Both too little & too much fluid can be harmful. Once the leakage phase is over, continuing excessive IV fluids can lead to fluid overload and pulmonary oedema*
>
> Dr Vinod Xavier, Kochi

As blood plasma leaks out into surrounding body cavities, the actual volume of blood circulating through the heart, brain, and vital organs rapidly shrinks, causing blood pressure to plunge. The sheer subtlety of this phase makes it perilous for families managing a sick relative at home.

"One critical stage is during the fall of the fever," warns Dr Aravinda S N, lead consultant in internal medicine at Aster RV Hospital, Bengaluru. "This may lead to an illusion of improvement in the condition of the patient. In cases of dengue, symptoms may develop during the transition period from febrile to critical stages; hence, monitoring of the patient should continue despite normalisation of temperature."

This deceptive phase is particularly treacherous in young children and non-verbal toddlers who cannot articulate internal distress. Dr Sheeja notes that parents must watch for paradoxical lethargy as the fever breaks. "Normally, as a fever subsides, a toddler should become more active and alert. In the critical phase, the child instead exhibits extreme lethargy and weakness," she says, noting that intractable vomiting (more than three episodes in an hour) and dark or decreased urine output are immediate triggers for urgent hospitalisation.

To navigate this threshold, clinicians rely on careful outpatient triaging to separate patients who can safely recover at home from those requiring admission.

"The vast majority of those suffering from dengue can actually be cared for at home under proper supervision as long as they don't have any warning signs," explains Dr Aravinda. "At outpatient triaging, the doctor evaluates the patient's symptoms, hydration, blood pressure, pulse, urine output, and general clinical state. The trend in the number of platelets and haematocrit (percentage of red blood cells) may also be taken into account along with the days passed. If the patient is stable, caregivers should provide oral rehydration solutions, soups, and fluids in small, frequent portions to avoid dehydration."

Throughout home care, caregivers must concentrate on fluid intake and urinary output rather than obsessing over blood platelet numbers — a major source of panic for families.

"Another common misconception I see is looking at the platelet count immediately once the fever comes down," says Dr Xavier. "In reality, the platelet count can continue to fall during the critical phase before recovering. Many patients try to 'boost' it by consuming large quantities of papaya or kiwi.

No particular food can suddenly change the natural course of dengue. In fact, patients often end up vomiting, which is counterproductive. I often tell – Don't treat the number, treat the patient.'

PREVENTIVE MEASURES

- Clear water from coolers and other small containers at least once in a week
- Use repellant during day time to prevent mosquito bites
- Identify and destroy mosquito breeding sources
- Spread awareness on vector-borne diseases among the public

'HYDRATION IS THE SINGLE MOST CRITICAL ASPECT'

WHEN dengue strikes a household, knowing how to protect and care for your child can make all the difference in their recovery. Navigating medicine safety, proper hydration, and emergency warning signs can feel overwhelming for worried parents. Dr Sheeja Sugunan, paediatric intensivist and associate professor at Government Medical College, Thiruvananthapuram, discusses critical dengue management strategies with **Unnikrishnan S**, providing clear, practical guidance every family needs. Edited excerpts:

Q Why are painkillers strictly unsafe during dengue, and how often can paracetamol be given?

Non-steroidal anti-inflammatory drugs like ibuprofen, mefenamic acid, and aspirin must be strictly avoided during dengue.

INTERVIEW
DR SHEEJA SUGUNAN

They inhibit platelet function and irritate the stomach lining, drastically increasing the risk of severe internal bleeding. Paracetamol is the only safe option for managing fever and pain. It should be given at a weight-appropriate dose every four to six hours, capped at four doses per 24 hours to prevent liver toxicity.

Q What specific liquids should a child drink besides water, and how many wet diapers or urine breaks mean they are safely hydrated?

Plain water alone is insufficient; electrolyte-rich fluids are needed to maintain blood pressure and prevent plasma loss. Ideal choices include ORS solution, salted rice starch water (kanji), tender coconut water, salted lemonade, and milk for infants.

Safe hydration is indicated by 4-6 wet diapers daily for infants, or 4-5 clear or pale-yellow urinations for older children. Going six hours without passing urine warrants immediate medical attention.
